GEO (General Electric Healthcare) developed MPR as part of their InfoSphere Portal Server integrated PACS system, which they designed to help physicians access and view DICOM data in a multi-platform browser [@GEO08]. MPR means multi-planar reformatting (3D) and multi-planar reformatting (axial and coronal) [@GEO08]. However, the MPR function is not present in the RadiAnt DICOM viewer. We must emphasize that the MPR, MIP and image fusion functions in the InfoSphere Portal Server integrated PACS system are based on the second PC desktop technology. The MPR function in the RadiAnt DICOM viewer allows users to quickly and easily display DICOM images, without a priori knowledge, and allow the user to easily view and select the images for use. Conclusion ===== The modern healthcare system demands high-quality imaging tools. Both physicians and patients prefer digital medical images. In that context, we created a new digital imaging

platform in the RadiAnt DICOM viewer and a virtual PACS environment. These environments were designed to assist physicians, engineers and radiologists in studying and processing medical images, regardless of the imaging modality, by integrating the DICOM standard and obtaining viewer-supported image-displaying, image-storing and image-archiving capabilities. We evaluated the medical image processing and image-processing features of the RadiAnt DICOM viewer and presented the main features of the Virtual PACS, including the DICOM interface, the image viewer, the image management system, the navigation system, the image-processing software, and the image-fusion software.
